- 13a First, give the genealogy, including public and commercial varieties, lines, or clones used, and the breeding method. Second, give the details of subsequent stages of selection and multiplication. Third, indicate the type and frequency of variants during reproduction and multiplication and state how these variants may be identified. Fourth, provide evidence on stability.
- 13b First, give any special characteristics of the seed and of the plant as it passes through the seedling stage, flowering stage and the fruiting stage. Second, describe the mature plant and compare it with a similar commercial variety grown under the same conditions, and indicate the differences.
- 13c A supplemental form will be furnished by the PVPO to describe in detail a variety for each kind of seed.

EXHIBIT A

This canning type pea was developed by crossing Small Sieve Alaska Strain M163 with our Alsweet Strain 148. Progeny of this cross were advanced to the F_3 generation where separate wrinkled and round selections were made. Seed produced from these F_3 selections was grown out and observed for doubling character. Only double podded plants were selected from the progeny of the F_3 round selections. This F_4 material was advanced to the F_6 generation where a bulk selection of wrinkled seeded material was increased to the F_8 where single plant selections were made on the basis of doubling, seed size, wrinkled, and plant size. This material was then increased to its present quantities over a four-year period.

During our increase period we have observed a tendency for this variety to throw an occasional plant (1:10,000) which will have thick-walled pods and larger ovules. We do feel that this is related to environment conditions and not a genetic breakdown of the seed. When these variants are planted they appear to be normal. As a precautionary measure, we have been annually processing this trial variety over a 17/64 round screen to eliminate these larger types. The genetic make-up of this variety is stabilized.
